

Samsung HBM2-PIM Phase 3

Native feasibility passes; Stage-1 regime claim remains inconclusive

- 30/30 mapped executions: zero bit mismatches and deterministic cycles
- Locked validation: 2.56% MAPE; 4.92% worst case
- Native FP16 only; low-precision PIM formats remain unsupported
- Im2col, host reductions, boundary costs, and avgpool are not validated end-to-end
- Required host/parametric/plan/checkpoint/split provenance was not located
- Joint and fixed-point sequential optimization: NOT EVALUATED (not zero gap)

Conclusion: simulator coverage and provenance are insufficient for a coupled-versus-separable claim.
